POTENTIAL MISINTERPRETATIONS OF STUDY DATA

This section of the Appendix addresses several theoretical issues that might lead to misinterpretations of the results. The first of these issues involves the question of interdependence among the factors used to disaggregate the increases in allowed charges observed in the five sample states from 1983 to 1985. Also included in this section are the justification for suppressing very small cells from some summary tables and a caution on the use of the data from the disaggregated analysis.

USERS, PERSONS SERVED, AND CLAIMANTS

In the five states in the sample a total of 1.32 million Medicare beneficiaries were recorded in the claims files as having used at least one service during 1983. By 1985 this figure had increased to 1.47 million, an increase of 10.9 percent. For the purpose of this study such beneficiariaries are referred to as "claimants" where a claimant is defined as a beneficiary who received a billed physician service that had a positive allowed charge provided during the year in one of the five states. This nomenclature has been adopted to distinguish claimants from both "users" of service and "persons served." The set of users of service may be considered to include all beneficiaries who receive a covered physician service regardless of whether a bill is submitted on their behalf. According to survey data from the early years of the program, the proportion of all Medicare Part B enrollees believed to be users under this definition was relatively stable at approximately 80 percent. The set of claimants is thus a subset of the set of

users. "Persons served" is a Medicare term of art that has appeared in a wide variety of statistical publications. The set of persons served includes only those beneficiaries who have had both a claim filed on their behalf and a payment made on their behalf, i.e., they have exceeded the Part B deductible. The set of persons served is thus a subset of the set of claimants.

NEW CLAIMANTS, ADDITIONAL CLAIMANTS, AND MARGINAL CLAIMANTS

A preliminary examinination of the components of increases in costs can begin with the following equations:

Total physician charges = (number of enrollees) * (claimants per enrollee) * (quantity of services used per claimant) * (average charges paid per service)

%Change in total physician charges = (%change in number of enrollees) + (%change in claimants per enrollee) + (%change in quantity of services used per claimant) + (%change in average charges paid per service) + (interaction term)[1]

The percentage change in the total can initially be assessed by examining the sum of the percentage changes in each of these four

---

1 This mathematical interaction includes both the cross-products of changes among all of the included factors plus changes within each factor not explicitly considered in the spending equation. For example, those changes would include changes in the number and types of services available and changes in data recording.

components plus their interaction term. With few exceptions some form of this decomposition has been utilized in all of the handful of time-series studies of changes in physician expenditures. In most analyses each of the factors is considered as independent of the others, even though in theory they may, in fact, be somewhat interdependent. In particular, it is conceivable that persons new to the Part B program in any year use fewer or less expensive services than those with previous experience in that program. To the extent that this occurs, one might misattribute some of the increases in allowed charges among the factors of disaggregation.

While this point is a theoretically valid one, completely assessing its empirical significance would have required an analysis beyond the scope of this study. A preliminary analysis of this issue was conducted using one of the five states from the sample. This analysis suggests that there is some interdependence among the factors being considered, but that its effects should be relatively minor.

As a preface to this analysis it will be necessary to distinguish between a variety of different types of claimants that may be observed in or inferred from the data files. First, in comparing the years 1983 and 1985, one can distinguish those beneficiaries who have claims in both years from those that have claims in 1983 only or those with claims in 1985 only. For the purpose of this analysis, the 1985 only cohort will be referred to as "new claimants" because they did not have a previous claim. Those with claims in both years will be referred to as "old claimants" in 1985.[2] Next, in counting claimants by place or type of service in each of the two years, one often observes that the

---

2 It is conceivable that ostensibly new claimants in 1985 might have had claims in either 1984 or some years prior to 1983. Since the data files are limited in time, making very fine distinctions would be of use only if the results of the gross analyses were more equivocal.

number of claimants in 1985 exceeds the number observed in 1983. These increases will be referred to as occasions of "additional claimants." These additional claimants will consist of both new claimants and old claimants who had not previously used a particular type or place of service combination. Of course one must also subtract from this formulation those claimants from 1983 for that place or type of service combination who are not claimants for those services in 1985. In the South Carolina data files examined for this analysis, roughly two thirds of 1985 claimants for most place/type of service combinations were found to be old claimants. With respect to the additional claimants in 1985 there was no consistent pattern with respect to the division between those new claimants and old claimants who were involved in a claim for a type or place of service not previously claimed. For additional claimants of outpatient department surgery, there were virtually equal numbers of old claimants and new claimants.

The question at hand involves whether old claimants and new claimants are basically similar, or whether the use of new claimants is marginal use, i.e., of much lesser expense than the average. If the latter were the case then the changes in claimants per enrollee and average approved charges per claimant would not be independent. Therefore the disaggregation might misattribute changes in total charges among the various factors.

To assess the possibilities, the 1985 data from South Carolina were partitioned into two categories: claims from "old" beneficiaries who also had claims in 1983, and those from "new" beneficiaries who did not have claims in 1983. To restrict the possibility that data from out-of-state claimants might influence the results, beneficiaries not having Social Security numbers issued in the State of South Carolina were deleted from the analysis. For the "old" claimants this eliminated roughly 40 thousand beneficiaries out of 176

thousand. For the "new" beneficiaries, roughly 35 thousand out of 100 thousand were eliminated.

Two types of analysis were conducted. In the first, total allowed charges for 1985 were computed for each beneficiary in order to compute and compare the means and frequency distributions for each cohort. As a preface, one would expect the "old" beneficiaries to have higher annual total allowed charges for two reasons. The "old" beneficiaries are likely to be older and hence may have higher expenditures. More important, since those beneficiaries exhibited claims in 1983, their 1985 Part B eligibility began on January 1 of that year, hence their data may be based on an average approaching 12 months of claims. The "new" beneficiaries may have a substantial proportion aging into eligibility. Therefore one might expect their data to be based on an average of as little as 6 months of claims.

The frequency distributions up to $2000 per year are shown in Figure R.1. There are no dramatic differences. One does note that the proportion of new beneficiaries not meeting the deductible through physician services provided in South Carolina in 1985 was approximately 40 percent compared to 25 percent for the old beneficiaries. However, in examining the average annual total allowed charges for beneficiaries who did exceed the deductible in 1985, the value for the old beneficiaries was $674 while that of new beneficiaries was $671. The aggregate distributions do not suggest that the bulk of the new claimants were marginal claimants.

A second analysis was conducted using both the number of claimants in each cohort and total allowed charges by type and place of service. In the aggregate, new claimants were found to be 37 percent of all claimants in 1985 (see Table R.8). The approved charges for those claimants were found to be 31 percent of total approved charges in 1985 (See Table R.9). Therefore one

might conclude that the new beneficiaries obligated only 84 percent of what would otherwise be their share of total allowed charges (See Table R.10). The major difference, however, derives from medical care services. For surgical services, particularly outpatient department surgery, total allowed charges for new claimants almost exactly matched their share of all claimants in 1985.

These combined results are consistent with the hypothesis that new claimants may be less expensive than old claimants, although the potential difference in months of eligibility could also have produced a similar result. The differences between the two cohorts, however, are not substantial. Further, it is clearly not the case that all new claimants are marginal claimants. If the average use of the new claimants is similar to the average use of old claimants, the new claims, when paid, would increase outlays directly in proportion to the average use of all claimants unless there was an offsetting shift downward in the average use of old claimants that would place a greater proportion of the distribution of all claims closer to the deductible. Such a downward shift in the use of old claimants towards the deductible would not be likely, for the reasons discussed above. Hence the assumption of independence between changes in the number of claimants and changes in the average annual allowed charges per claimant may not be seriously violated.

5 A NEW CLAIMANT IS DEFINED AS A BENEFICIARY WITH CLAIMS IN 1985 BUT NOT IN 1983.

6 NUMBERS GREATER THAN 100 SUGGEST THAT NEW CLAIMANTS USE MORE THAN THEIR SHARE OF APPROVED CHARGES, NUMBERS LESS THAN 100 SUGGEST THAT NEW CLAIMANTS USE LESS THAN THEIR SHARE OF APPROVED CHARGES.

EXECUTING A DISAGGREGATION

While straightforward in theory, the actual disaggregation of changes in allowed charges is not so easy to effect. There are two challenges that must be met. The first involves the degree of disaggregation. The second involves what will be called misdirection by magnitude. Both of these areas are addressed in turn.

The multiplicative disaggregation is conceptually neat and appealing. Where it can suffer, however, involves disaggregations that are not multiplicative. For example, there is no simple multiplicative disaggregation of Medicare allowed charges by place of service or type of service. One can partition the data (such as by type of service) and analyze each part using the multiplicative model. However, while each of these non-multiplicative, disaggregated parts might be further disaggregated using the multiplicative approach, the relative sizes of the parts get lost.

Because this problem is unlikely to be completely eliminated, a two step approach will be used. The total change in total allowed charges will be computed from the five state data set. Within each of the five states and for the aggregation, that total change in total allowed charges will be used to assess changes in charges within a particular cell of disaggregation. For example, between 1983 and 1985 the total increase in allowed charges for the five state aggregate was $138.6 million. The increase in allowed charges for surgical services in outpatient department settings was $53.4 million, or a value equal to 38.6% of the total change. The percentage increase from 1983 to 1985 for outpatient department surgical services was 324.4%. The percentage increase for anesthesia services in outpatient departments was higher, 731.1%.

However, when the absolute increase in outpatient anesthesia allowed charges is compared to the grand total, it is equal in value to 3.2% of that grand total. These differences are illustrated in the accompanying text table on relative sizes of changes in allowed charges. Because some of the within cell percentage changes between 1983 and 1985 are so large but their relative change is so small, entries in the percentage change tables are suppressed for those cells where the value of the absolute change is less than 0.1 percent of the total change.[7]

RELATIVE SIZES OF CHANGES IN ALLOWED CHARGES

"CELL"	1983	1985	CHANGE	%CHANGE	CHANGE AS A PERCENT OF TOTAL CHANGE
ALL	$741,051,160	$879,606,718	$138,555,558	18.7	100.0
OPD					
SURG	16,470,592	69,899,066	53,428,474	324.4	38.6
ANES	615,579	5,116,099	4,500,520	731.1	3.2

MAGNITUDE MISDIRECTION

While of course everyone knows that numbers themselves don't lie, numerical presentations may be misleading. Using the multiplicative disaggregation, in particular, almost invites misinterpretations, specifically in situations where some factors are increasing but other factors are decreasing. For example, in the five states aggregate, there was an increase in allowed charges of 18.7 percent. There was an increase in users of service of 10.9 percent. This means that the sum of changes in services per user and

7 For example, there was a 29737 percent increase in approved charges for home radiation therapy. However, in 1985 this amounted to $15,115 of the total increase in approved charges, or just one one-hundredth of one percent.

changes in allowed charge per service can be expected to total approximately 8 percent. It does not mean that both of those two changes must be less than 8 percent. In fact, services per user declined by 9 percent while allowed charges per service increased by 17.5 percent. Their sum is indeed approximately 8 percent, but both factors had changed (in absolute values) by more than 8 percent.

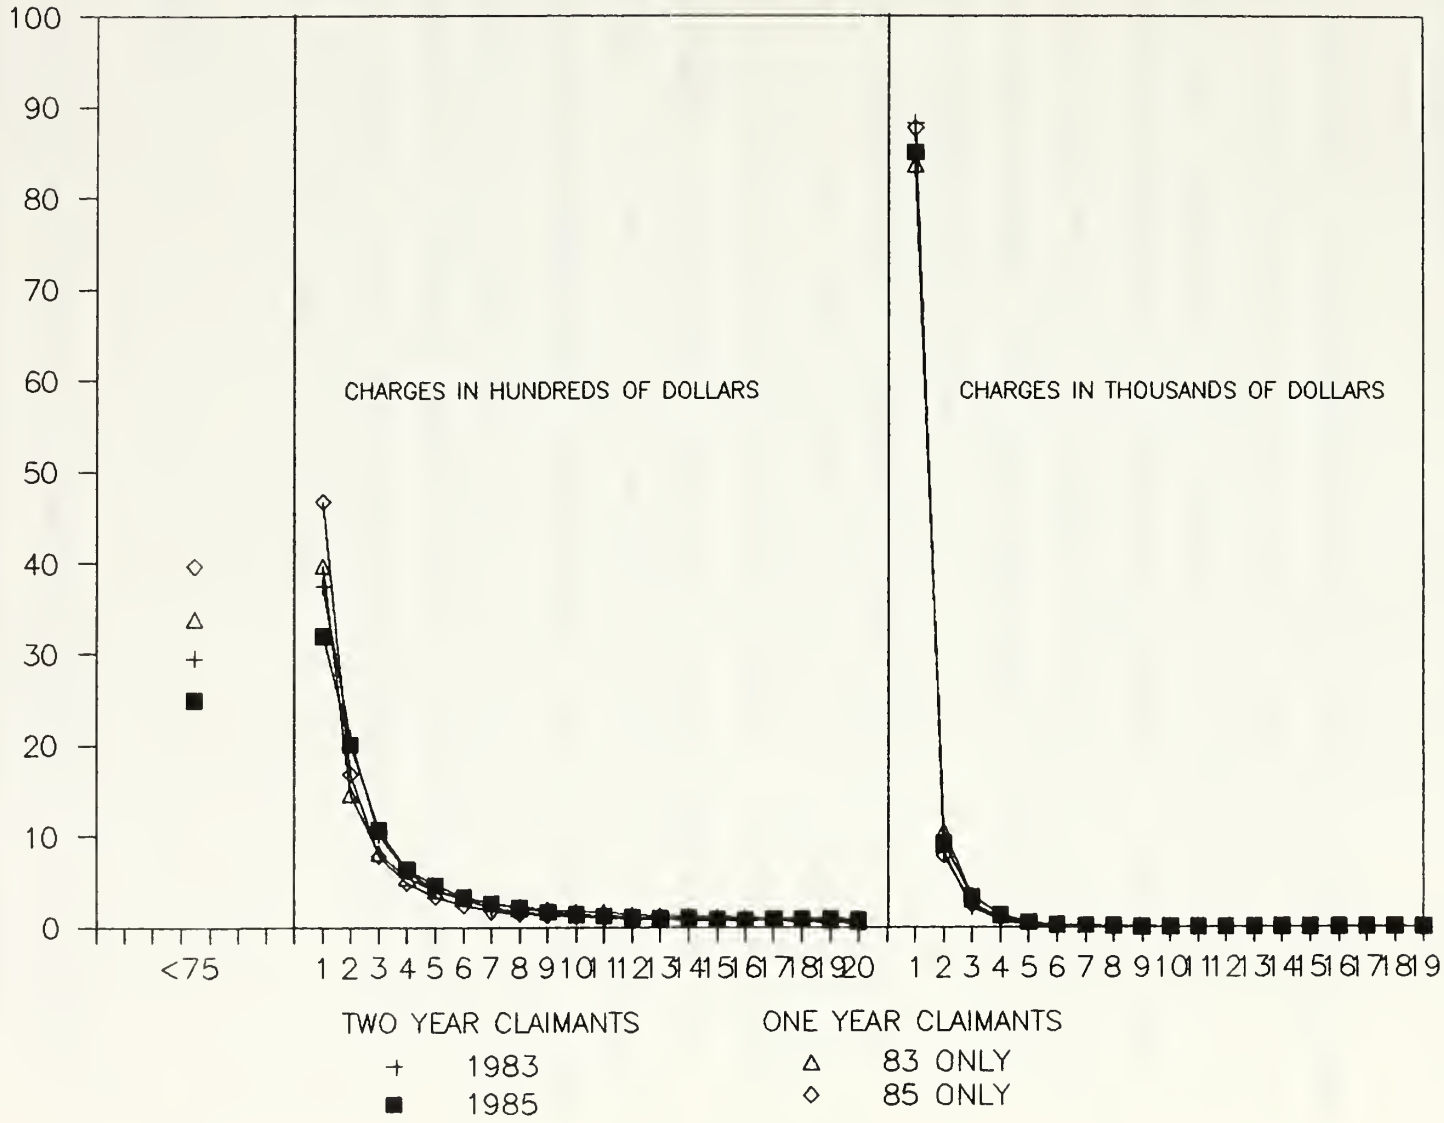
Unless all the percentage changes being considered have the same sign, one's attention can get misdirected. In fact, even if all of the signs are the same, one still can get distracted. For example, for some of the analyses, patients were partitioned into two groups; those hospitalized at least once during the year and those never hospitalized. Between 1983 and 1985 for the hospitalized group, the average allowed charge per service for surgical services increased by 20.6, 0.5, and 83.6 percent, respectively, for place of service office, inpatient, and outpatient department.[8] However, the average allowed charge per service for all surgery for those patients declined by 2.7 percent. This is because the average allowed charge for outpatient department surgery was below that of inpatient surgery. Because outpatient department surgery was becoming a much larger share of the total, the average across the board was brought down toward the OPD level. Hence the average charge for surgery declined even when virtually all surgery charges were rising.

Although the potential for misdirection exists, the potential insights from the multiplicative disaggregation warrant its use in this regard. Having been given this additional set of arms, one can proceed with the review of the data.

---

8 These settings encompassed more than 98 percent of all approved charges for surgery in 1985.

FIGURE R.1 PERCENTAGE FREQUENCY DISTRIBUTIONS OF ANNUAL ALLOWED CHARGES
SOUTH CAROLINA CLAIMANTS, VARIOUS COHORTS



PRIMARY TABLES WITH RESPECT TO CHANGES IN ALLOWED CHARGES BY TYPE AND PLACE OF SERVICE

This section of the Appendix includes virtually all of the original tables for the five state aggregate data and for each of those states. In order to facilitate reader examination of those tables, an overview is provided of several selected results from the five state aggregate. In addition, a guide to each table is provided in the next section to help the reader understand how the tables were assembled. The actual tables follow in a third section, and constitute the bulk of this volume.

The nomenclature for identifying the tables is as follows: there are eighteen sets of tables with ten tables in each set. The eighteen sets are based on six jurisdictions and three patient partitions. The first jurisdiction is the five state aggregate [5S]. Each of the individual states is its own jurisdiction. The state order is by beneficiary eligible counts, producing the following sequence: Indiana [IN], Washington [WA], South Carolina [SC], South Dakota [SD], and North Dakota [ND]. The three patient partitions involve (1) all patients [A], (2) only those patients with one or more hospitalizations during a particular year [H], and (3) only those patients without a single hospitalization during a particular year [N].

OVERVIEW

This study was limited to an examination of Medicare Part B physician services only. Those factors that were examined included total allowed charges, total users of physician service, and total physician services. In

addition, two aggregate measures were examined: average annual services per user of service, and average allowed charge per service.

Total allowed charges across the five sample states totaled $741 million in 1983 and $880 million in 1985, a growth over those two years of 18.7 percent. These data by selected places and types of service are presented in Table 5S.A.1.

Allowed charges for physician services provided in the hospital setting showed negative growth during the two-year period; $463 million in 1983 to $451 million in 1985. However, the small drop in inpatient charges for surgery from $217 million in 1983 to $214 million in 1985 was more than offset by the increase in charges for surgery in an outpatient setting from $16.5 million in 1983 to $69.9 million in 1985. Charges for all other types of service provided in the outpatient setting increased markedly. Charges for anesthesia services and assistance at surgery also increased in concert with the increase in outpatient surgery. Total allowed charges for outpatient physician services increased from $45 million in 1983 to $122 million in 1985. At the same time, total allowed charges for services provided in physician offices increased from $206 million to $263 million. The increase of $77 million in outpatient departments was greater than the $57 million increase in all types of services in physicians' offices. As will be noted in the next section, the percentage changes in total allowed charges by place and type of service are detailed in Table 5S.A.7.

In the five states in the sample a total of 1.32 million Medicare beneficiaries used at least one service during 1983. By 1985 this figure had increased to 1.47 million, an increase of 10.9 percent. These data by selected type and place of service are presented in Table 5S.A.2. A user has been defined as a beneficiary who received a billed physician service during the

year provided in one of the five states and that had a positive allowed charge.

One caution must be mentioned with respect to all of the tables involving users of service. Except as noted, a user of service is most often defined with respect to a particular place and a particular type of service. Thus in 1983 there were 1.10 million users of *medical care* services in *physician offices*. The total number of users of all *medical care* services in that year was 1.24 million, and the total number of users of any type of service in *physician offices* was 1.16 million. However, because a beneficiary could have used many different types of service in many types of settings, one can not sum across the rows to produce row totals, nor down the columns to produce the column totals. Those table marginals were produced separately by developing distinct counts for each combined cell.

A total of 25.4 million physician services was provided in 1983 compared to a total of 25.6 million in 1985, an increase of 1 percent. These data are presented in Table 5S.A.3. The aggregate net growth figure resulted from a drop of 22.5 percent in physician services provided in-hospital and a commensurate increase in services provided in all other places. Except for consultations all types of in-hospital services decreased, with pathology services dropping from 1.4 million to .3 million, or 79 percent and medical care services dropping from 6.1 million to 4.8 million or 22 percent. All other places of service showed increases ranging from 1.5 million services in physician offices, .6 million in outpatient settings, .7 million in laboratories, and 27 thousand in patients' homes.

The impact of the prospective payment system for reimbursing hospitals is likely reflected in these changes. Also, during this period, HCFA changed the basis for physician billing for the professional component of pathological

services to allow only anatomic pathology or surgical pathology procedures to be billed to Part B of Medicare. These changes in regulations resulted in the drop of 79 percent in pathology services provided in hospital.

There may be some question as to whether these changes in pathology are real changes or paper entries. The changes in billing regulations relabelled former Part B lab tests as Part A lab tests, so it is possible that these services are still being provided, but not being recorded under Part B. The service growth of all other services aside from pathology services in hospital was 5.8 percent rather than the 1 percent for all services.

The 5.8 percent estimate, however, has to be viewed as a maximum estimate. In transferring the interpretations to Part A, there was a 0.13 percent adjustment <u>in hospital DRG rates only</u> to compensate for the change. Hence, if hospitals have continued to provide those lab tests they have done so out of their PPS revenues without additional cost to Medicare. In fact, the per admission reduction in inpatient pathology services estimated across the five states, 5.49, is nearly equal to the reduction nationally estimated by PROPAC, 5.30. In that sense, the 20 percent decline in allowed charges for pathology services provided in hospital was real, not simply a Part B to Part A transfer. Further, the evidence on the Part B side suggests that it was the relatively simple interpretations that have been eliminated from Part B billings. The average allowed charge per service for inpatient pathology increased from $8.54 to $32.30. The ratio of the change in total allowed charges for inpatient pathology to the change in the number of pathology services in that setting was $2.11.

On the other hand, one might well expect that the changes in service volume due to the introduction of PPS and the changeover in pathology billing have been exhausted. Essentially they were one time events. Hence even if

there were no further increases in inpatient services, increases in the number of services in all other settings could be expected to lead to increases in expenditures for physician services not counterbalanced by declines in the hospital setting.

READING THE TABLES

As indicated above this section of the Appendix contains eighteen sets of tables with ten tables in each set. The eighteen sets are the product of three patient partitions and six sets of jurisdictions. With respect to the All patient set, one can imagine this set as the sum of the Hospitalized set and the Non-hospitalized set, although the numbers were actually derived from a combined data set. With respect to the five state aggregate jurisdiction [5S], the numbers were derived from the mathematical addition of the data from all of the five states. The only possibility that that process may have entered noise into the resulting tables involves the counts of users in the States of North and South Dakota. Those Medicare beneficiaries who received service in both jurisdictions in the same year may have been double-counted in the aggregate totals. Given the lack of a major city on their common border and the fact that those two jurisdictions in their entirety represented 13 percent of the total in 1985, the potential dual state user inaccuracies should be small.

The ten tables can also be thought of as representing two sets of five tables each. Tables 1-5 in each set present "raw" numbers from both 1983 and 1985. Tables 6-10 in each set are based on the changes observed between 1983 and 1985. As will be explained below, Table 6 identifies each place and type of service cell that was no less than .05 percent of the value of the net increase for all types and places of service for any jurisdiction.

Any cells that did not meet that criterion have been suppressed. Thus Tables 6-10 allow the reader to focus on those cells that had at least a modest contribution to the changes in allowed charges between 1983 and 1985. This relieves the reader from the distraction of cells that would exhibit otherwise spectacular increases from miniscule bases. However, because the original data are presented in Tables 1-5, the reader can compute rates of change for any cell of interest.

The ten tables are as follows:

TABLE 1	TOTAL ALLOWED CHARGES FOR PHYSICIAN SERVICES BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 AND 1985
TABLE 2	TOTAL USERS OF PHYSICIAN SERVICES BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 AND 1985
TABLE 3	TOTAL PHYSICIAN SERVICES BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 AND 1985
TABLE 4	AVERAGE ANNUAL PHYSICIAN SERVICES PER USER BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 AND 1985
TABLE 5	AVERAGE ALLOWED CHARGE PER SERVICE BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 AND 1985
TABLE 6	PERCENTAGE DISTRIBUTION OF CHANGES IN TOTAL ALLOWED CHARGES FOR PHYSICIAN SERVICES BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 TO 1985
TABLE 7	TWO YEAR PERCENT CHANGE IN TOTAL ALLOWED CHARGES FOR PHYSICIAN SERVICES BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 TO 1985
TABLE 8	TWO YEAR PERCENT CHANGE IN USERS OF PHYSICIAN SERVICES BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 TO 1985

TABLE 9 TWO YEAR PERCENT CHANGE IN AVERAGE ANNUAL PHYSICIAN SERVICES PER USER BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 TO 1985

TABLE 10 TWO YEAR PERCENT CHANGE IN AVERAGE ALLOWED CHARGE PER SERVICE BY SELECTED PLACES AND TYPES OF SERVICE, FIVE STATE AGGREGATE, ALL PATIENTS, 1983 TO 1985

Elements Common to All Tables

The row and column headings for all of the tables are identical. Rows denote types of service. The mnemonics used for those types of service are as follows:

MED	medical care
SURG	surgery
CONS	consultations
DXRAY	diagnostic xray
PATH	pathology
RAD	therapeutic radiology
ANES	anesthesia
ASSIST	assistance at surgery
TOT	all types of service including those not separately listed, i.e., the sum of the eight labelled rows should not be expected to be identical to the row labelled "TOT."[9]

---

9 With respect to Tables 2, 4, and 8, the TOT row involves users of all types of service. The number of users of all types of service is the number of elements in the mathematical union of all of the sets of users by type of service. In all of the tables the TOT row will not be less than the greatest individual row. However, the users of all service will be less than the sum of each of the users of the individual services. For the other tables the TOT row is likely to exceed the sum of the individual service rows.

Columns denote places of service. The mnemonics used for place of service are as follows:

OFF	physician office
HOME	patient home
HOSP	inpatient hospital
NURS	skilled nursing facility
OPD	outpatient hospital
LAB	laboratory
ALL	all places of service including those not separately listed, i.e., the sum of the eight labelled columns should not be expected to be identical to the column labelled "ALL."[10]

Individual Tables

Table 1	The entries in each cell of Table 1 involve the sum of allowed charges for that cell. Separate entries are provided for both 1983 and 1985.
Table 2	The entries in each cell of Table 2 involve the number of unique users of services represented by each cell. Separate entries are provided for both 1983 and 1985.
Table 3	The entries in each cell of Table 3 involve the total number of services provided in that cell. Separate entries are provided for both 1983 and 1985.
Table 4	The entries in each cell of Table 4 involve the mathematical ratio of the relevent entries of Table 3 and Table 2. That is, each entry is an estimate of the average annual number of services per user of that type and place of service. Separate entries are provided for both 1983 and 1985.
Table 5	The entries in each cell of Table 5 involve the mathematical ratio of the relevent entries of Table 1 and Table 3. That is, each entry is an estimate of the average allowed charge per service for that type and place of service. Separate entries are provided for both 1983 and 1985.
Table 6	Table 6 involves computations from both the 1983 and 1985 sections of Table 1. The absolute difference

---

10 With respect to Tables 2, 4, and 8, the ALL column involves users in all places of service. The number of users in all places of service is the number of elements in the mathematical union of all of the sets of users by place of service. In all of the tables the ALL column will not be less than the greatest individual column. However, the users of all service will be less than the sum of each of the users of the individual services. For the other tables the ALL column is likely to exceed the sum of the individual service columns.

between the corresponding 1983 and 1985 cells is expressed as a ratio to the net increase in total allowed charges, viz., the absolute difference between the 1983 and 1985 entries for all types of service in all places of service. [The TOT row of the ALL column.] For this reason, the TOT row of the ALL column is 100.0 in Table 6 for each of the all patient partitions [A]. For the hospital [H] and non-hospital [N] partitions, the Table 6 entry in the TOT row of the ALL column is never 100.0. With one exception, the net increase in total allowed charges for all services in all places of service is always greater than the net increase for either of the two patient subsets.

In Table 5S.A.1, one finds that $115 million was allowed for medical care services in physician offices in 1983 compared to a total of $144 million in 1985, a net increase of $29 million. The net increase for all services in all places of service was $139 million. As a result, the net increase in allowed charges for medical care services in physician offices was equal in value to 20.8 percent of the net increase in all types and places of service. Note that in Table 5S.N.1, between 1983 and 1985 the net increase in allowed charges for all types and places of service was $83 million. Thus in Table 5S.N.6, the net increase in allowed charges for all types and places of service was equal in value to 59.7 percent of the net increase in allowed charges for all types and places of service for all patients.

Tables 6-10 suppress the values for any cell that would have had a Table 6 value less than .05 percent. Thus, for example, there is no entry in Table 5S.A.6 for assistance at surgery in physicians' offices. From Table 5S.A.1 one can infer that there was a $14 thousand increase in allowed charges for those services. This is roughly .01 percent of the value of the increase in allowed charges for all places and types of service.

Table 7 — Table 7 presents the two year rate of change in allowed charges for each reported cell expressed as a percent.

Table 8 — Table 8 presents the two year rate of change in users of service for each reported cell expressed as a percent.

Table 9 — Table 9 presents the two year rate of change in services per user of the relevent service for each reported cell expressed as a percent.

Table 10 — Table 10 presents the two year rate of change in average allowed charges per service for each reported cell expressed as a percent.

TABLES

The eighteen sets of tables follow. The order of the tables begins with the all patients sets of tables followed by the hospitalized patients followed by the non-hospitalized patients. With each of those sets the first jurisdiction is the five state aggregate, followed by Indiana, Washington, South Carolina, South Dakota, and North Dakota.

TABLES 5S.A.1-10

THESE TABLES APPLY TO DATA FOR THE FIVE STATE AGGREGATE [5S]. THEY ARE DERIVED FROM DATA INCLUDING ALL PATIENTS: BOTH THOSE HOSPITALIZED DURING A PARTICULAR YEAR AND THOSE WITHOUT A SINGLE HOSPITALIZATION DURING THAT YEAR. THE TABLES APPEAR ON PAGES A.3.11-A.3.15. THE EXPLANATIONS OF THE ENTRIES IN THESE TABLES APPEAR ON PAGES A.3.5-A.3.10 OF THIS VOLUME.

CONTRAST TABLES BY PLACE AND ENHANCED TYPE OF SERVICE

This section of the Appendix provides a slightly different perspective on changes in allowed charges by type and place of service. Given the pronounced increase in services and allowed charges for outpatient surgery an effort was made to ascertain the types of surgery that were increasing in this sector. Unfortunately, the experience in examining the potential upcoding for procedures showed that because of technology and coverage changes, selecting specific HCPCS codes to examine volume changes was potentially unreliable in generating data representative of any particular set of services. For this reason an "enhanced" type of service partition was generated to examine a mid-range level of disaggregation of surgical (and medical) services. The enhanced type of service initially partitions services by first digit of the HCPCS code. For HCPCS codes beginning with a 3, 4, or 5, a separate partition distinguishes endoscopies from other surgeries. For HCPCS codes beginning with a 6, cataract operations are distinguished from all other surgeries in this category. This yielded a taxonomy of 11 surgical categories. Medical care was partitioned into three sections: office visits, hospital visits, and all other services with a medical care type of service code, i.e., everything but office visits or hospital visits.

These tables report each enhanced type of service in the aggregate and by place of service. This includes the six "primary" places of service generally reported in the text as well as "other places," kidney treatment centers, ambulatory surgical centers, and any other places not matching recognized HCFA codes. One might note that while ambulatory surgical centers

showed substantial growth in the five states from 1983 to 1985, they accounted for .4 percent of total allowed charges in 1985 and .04 percent of all services.

There is a table for the five state aggregation and for each of the five states. Each table covers 8 pages. The first page presents aggregate data by enhanced type of service including the percentage of 1983 total allowed charges represented by each enhanced type of service and the percentage of the 1983/85 growth in total allowed charges represented by each service. A guide to the acronyms used in these tables is presented on the first page of each table. The second and subsequent pages of each table disaggregate the data by place and enhanced type of service.

Note: a dash [-] in the charges or services columns indicates a positive value less than 1000. A zero [0] indicates a true zero. Percentage computations involving quantities less than one thousand are also indicated with a dash. Percentage computations involving zero amounts are indicated with a blank.

Note: a dash [-] in the charges or services columns indicates a positive value less than 1000. A zero [0] indicates a true zero. Percentage computations involving quantities less than one thousand are also indicated with a dash. Percentage computations involving zero amounts are indicated with a blank.

Note: a dash [-] in the charges or services columns indicates a positive value less than 1000. A zero [0] indicates a true zero. Percentage computations involving quantities less than one thousand are also indicated with a dash. Percentage computations involving zero amounts are indicated with a blank.

Note: a dash [-] in the charges or services columns indicates a positive value less than 1000. A zero [0] indicates a true zero. Percentage computations involving quantities less than one thousand are also indicated with a dash. Percentage computations involving zero amounts are indicated with a blank.

Note: a dash [-] in the charges or services columns indicates a positive value less than 1000. A zero [0] indicates a true zero. Percentage computations involving quantities less than one thousand are also indicated with a dash. Percentage computations involving zero amounts are indicated with a blank.
